

FABIANO ISHIY ZAPAROLI

Staff Software Engineer | Fullstack Ruby on Rails · React · Integrations & Production Systems

Email: fabianozapa@gmail.com

Brazil (Remote)

WhatsApp / Mobile: +55 11 95875-8572

Engagement: Independent contractor (1099) — full-time, embedded engineering roles · international remote

LinkedIn: [linkedin.com/in/fabiano-ishiy-zaparoli](https://www.linkedin.com/in/fabiano-ishiy-zaparoli)

Work authorization: Brazilian citizen · remote contractor for US/international companies

PROFESSIONAL SUMMARY

Staff Software Engineer with 14 years building fullstack marketplace and SaaS platforms — pricing engines, inventory systems, third-party integrations, and production debugging at scale. Seeking full-time, embedded independent contractor (1099) roles with US and international companies.

Recently Staff at Effortless Ads on Google Cloud, driving technical direction for property-data ingestion, campaign automation, and full-stack product engineering (1,000+ active campaigns; ~60% backend / 40% React). Prior senior individual contributor (IC) work at Drip (100–150M email/SMS events/month) and fullstack engineering at Shift (NASDAQ-listed marketplace). Earlier: CTO at BDS Turismo (B2B travel); co-founder of P2P Milhas (airline mileage marketplace); built the Ikarus flight-search API ecosystem.

Advanced English through years of daily work in US remote teams. Independent contractor for US/international companies since 2020.

Selected Impact

- At Effortless Ads, designed and built a Google Cloud Functions property-data scraper (Puppeteer, proxy/captcha services, OpenAI API) — replacing rising Property Management System (PMS) API costs for ad generation and eliminating recurring third-party integration fees across 1,000+ active campaigns.
- Resolved intermittent failure of millions of marketing messages/month at Drip by diagnosing thread-safety issues in the Shopify gem under Sidekiq and migrating workloads to Resque.
- Solely integrated Yotpo at Drip; built vehicle-data scraping and marketplace features at Shift; Uber and Cabify (ride-hailing) delivery integrations at Consulta Remédios (online pharmacy marketplace).
- Built real-time flight pricing scrapers and fare comparison systems at MaxMilhas and across the Ikarus / BDS / P2P marketplace ecosystem.

CORE TECHNICAL EXPERTISE

Backend

Ruby, Ruby on Rails, PHP, Laravel, CakePHP

Frontend

React.js, JavaScript, TypeScript, HTML, CSS, Bootstrap, jQuery

Data & Infrastructure

Google Cloud (Cloud Functions, Cloud Run), PostgreSQL, MySQL, MongoDB, Redis, Puppeteer, Docker, DigitalOcean

Observability & CI/CD

Datadog, Sentry, Honeybadger, New Relic, GitHub Actions, CircleCI, Sidekiq, Resque

Integration Technologies

REST APIs, SOAP APIs, Webhooks

Engineering Practices

TDD, CI/CD, Git Flow, RSpec, Minitest, Capybara, Selenium

Specialized Areas

Rails Architecture
Metaprogramming
API Design
System Integrations
Web Crawlers / Scraping (Puppeteer)
AI-Assisted Data Extraction (OpenAI API)
Transaction Management
Query Optimization
Production Debugging
Observability & RCA

PROFESSIONAL EXPERIENCE

Effortless Ads — Staff Software Engineer

Mar 2023 – Apr 2026 | Remote · Independent contractor (1099)

Role: Staff-level IC on a Google Cloud–hosted Google Ads automation platform. Translated product feature requests into end-to-end implementation strategy — evaluating system-wide impact, selecting technologies, external APIs/services, and code structure. Shared technical direction with peer engineer; mentored developers on codebase and architecture. Full-stack delivery (~60% backend / 40% React).

- Proposed, designed, and built a property-data scraper on Google Cloud Functions to replace rising Property Management System (PMS) API costs for Effortless Ads ad generation — PMS integrations (REST/SOAP) already existed for KeyTexting and Effortless; my scope was minor maintenance only. Effortless needed less PMS detail and better data from property websites.
- Scraper architecture (~2 months to v1): Puppeteer with third-party proxy and captcha services; link discovery via string-approximation algorithms and OpenAI API; multi-page parsing using meta tags, JSON-LD, regex, and OpenAI API extraction from semantically chunked

HTML (chunk classification → field extraction → normalization across multiple sources); image extraction filtered via OpenAI API; Google Search fallback to listings sites (Apartments.com, RentCafe, Trulia, Zillow) when primary property sites failed.

- Eliminated recurring Property Management System (PMS) integration costs while preserving data consistency across 1,000+ active campaigns.
- Delivered campaign automation, SMS workflow integrations, and property-data ingestion on a fully Google Cloud-based platform.
- Engineering team grew from 2 to a larger cross-functional org after acquisition of a Uruguayan engineering company.
- Stack: Ruby, Rails, React, JavaScript, MySQL, Redis · Google Cloud Functions, Cloud Run · Puppeteer · OpenAI API · Datadog · GitHub Actions · RSpec · TDD

Shift — Senior Ruby on Rails Developer

Dec 2021 – Feb 2023 | Remote · Independent contractor (1099)

Role: Full-stack product engineering at a NASDAQ-listed marketplace. Delivered features, bug fixes, and platform maintenance as part of a distributed engineering team.

- Designed and implemented a vehicle-data scraping solution for extracting information from an external platform without an official API.
- Contributed to marketplace features and backend services through collaborative, subdivided team delivery.
- Contract ended during company-wide contractor reductions amid financial restructuring; company filed for bankruptcy later that year.
- Stack: Ruby, Rails, TypeScript, JavaScript, Bootstrap · PostgreSQL, MySQL, MongoDB · Sentry · CircleCI · GitHub Actions · RSpec · TDD

Drip / Tarmac.IO — Senior Software Engineer

Nov 2020 – Dec 2021 | Remote · Independent contractor (1099)

Role: Senior IC via Tarmac.IO at Drip, a marketing automation platform (~6,000 customers; 100–150M email/SMS events/month). Integration systems, event processing, and production debugging.

- Investigated long-standing production failures where millions of messages intermittently failed to send. Identified thread-safety issues in the Shopify gem (credential storage in module-level variables under Sidekiq); proposed and executed migration to Resque's forked execution model.
- Solely designed and implemented Yotpo integration.
- Built webhook-driven event systems, API clients, and Shopify / WooCommerce integrations.
- Stack: Ruby, Rails, JavaScript, Elm, FlightJS · PostgreSQL · Sidekiq, Resque · Honeybadger · CircleCI · GitHub Actions · Minitest · TDD

Consulta Remédios (Online Pharmacy Marketplace) — Senior Software Engineer

Jul 2020 – Nov 2020 | Brazil · Independent contractor

Context: Short-term role; transitioned to international remote contracts with US companies.

Role: Backend development for a pharmacy marketplace — multi-tenant systems and delivery integrations.

- Designed and implemented Uber and Cabify delivery-provider API integrations.
- Built tenant-isolated operational workflows on SpreeCommerce-based marketplace backend.
- Stack: Ruby, Rails, JavaScript, jQuery · PostgreSQL, MongoDB · New Relic · CircleCI · GitHub Actions · RSpec · Selenium · TDD

P2P Milhas (Airline Mileage Marketplace) — Co-Founder & CTO

Jan 2017 – Jul 2020

Context: Co-founded as equity partner with BDS Turismo to enter the B2C segment. Shared backend systems (mileage inventory, purchase, semi-automated ticket issuance) with separate B2B/B2C e-commerce fronts connected via REST API. Company wound down during COVID-19.

Role: Co-founder, product strategy, system architecture, and full-stack development for a B2C airline-ticket marketplace.

- Built consumer-facing e-commerce (SpreeCommerce) on top of shared backend systems also used by BDS Turismo.
- Implemented and connected shared services — mileage inventory, purchase workflows, semi-automated ticket issuance — to the B2C storefront via REST API.
- Integrated Ikarus flight search API ecosystem for pricing and search.
- Stack: PHP, Ruby, Rails, SpreeCommerce, CakePHP, JavaScript, jQuery

BDS Turismo (B2B Travel Agency Marketplace) — CTO / Senior Software Engineer

Sep 2015 – Dec 2021

Context: Hired to build B2B marketplace systems for travel agencies — same business model as MaxMilhas, serving agencies instead of end consumers. Later co-founded P2P Milhas (B2C only) as equity partner; shared backend systems with separate e-commerce fronts. P2P wound down during COVID-19 (Jul 2020); BDS continued through Dec 2021 (one-week gap before Shift).

Role: CTO — technical leadership, system architecture, and product engineering. Led a team of 2–3 engineers (architecture, code review, mentoring, hiring).

- Designed and implemented shared backend systems: mileage inventory, purchase workflows, semi-automated ticket issuance, and Cash Milhas (mileage inventory reconciliation) — with separate B2B (BDS Partner Platform) and B2C (P2P Milhas) SpreeCommerce storefronts connected via REST API.
- Built real-time flight search/pricing engine (cash + mileage fares) and B2B airline-ticket distribution with financial consistency controls.
- Integrated Wintour (travel-agency financial ERP) via SOAP API for financial administration and Ikarus API ecosystem for flight search, pricing, and ticketing.

- Introduced a browser extension for semi-automated ticket issuance, reducing manual steps while preserving human validation.
 - Configured DigitalOcean infrastructure and deployment pipelines. Stack: PHP, Ruby, Rails, SpreeCommerce, CakePHP · PostgreSQL, MySQL · New Relic · Git Flow · CI/CD · TDD
-

Ikarus Intelligent Systems — Founder / CEO / CTO

Feb 2014 – Aug 2015

Context: Founded after leaving MaxMilhas to build a software services company. Evolved the flight pricing scraper into a reusable API platform plus e-commerce solutions for travel companies.

- Designed and implemented the Ikarus Flight Search API — real-time cash airfare and mileage redemption pricing aggregation with API-first architecture.
 - Delivered ticketing, integration APIs, and custom e-commerce systems for marketplace clients.
 - Platform later became the shared pricing and search layer for BDS Turismo and P2P Milhas.
 - Stack: PHP, Ruby, Rails, SpreeCommerce, CakePHP, JavaScript
-

MaxMilhas (Airline Mileage Marketplace) — Software Developer

Apr 2013 – Jan 2014

Context: Early-stage B2C marketplace buying mileage inventory from individuals and reselling flights at competitive prices via real-time fare comparison against airline-direct pricing.

- **Contracted:** Built real-time flight pricing scraper and customer-facing fare comparison engine (cash vs. mileage-based fares) — core to the company's conversion model.
 - **Employed:** Worked on the PHP monolith handling payment integrations, mileage inventory, and marketplace operations.
 - Stack: PHP, Ruby, SQL, JavaScript, CakePHP, jQuery
-

Freelance Web Development - Software Developer

Apr 2012 – Mar 2013

Activities:

Software development, database maintenance, and web data extraction.

Main programming languages used:

PHP, Ruby, SQL, JavaScript, HTML, CSS

Main libraries used:

CakePHP, jQuery

EDUCATION

Federal University of Minas Gerais (UFMG)

Bachelor's Degree in Information Systems

2008 – 2014

LANGUAGE SKILLS

Portuguese: Native

English: Advanced — daily use in remote international teams since 2020 (standups, architecture reviews, documentation, presentations).

CURRENT TECHNICAL PROJECTS

AI-Assisted Backend Deployment Automation

Personal project focused on orchestrating backend code generation as modular service-like units with strong adherence to structural and behavioral design patterns.

The project simulates engineering workflow stages from implementation through pre-deployment validation using AI-assisted generation pipelines.
